

ABSTRACT

An easy assembled tube connector is disclosed. A buckling ring is embedded into a tube body and a connecting seat of a tube joint is engaged into the buckling ring. Then it is rotated through a 5 predetermined angle so as to complete the assembly work. The tube joint with the connecting seat is made as a multi-directional joint so as to connect a plurality of tube bodies. Thus, the tube joint can be used to different lamp tubes, display tubes, electric tubes, wire tubes, etc., especially for the tubes with wires therein or high pressure tubes.
